Was the information shown in this page useful? Give us feedback

11:51 AM 9/1/2026

VIVA QUESTIONS :

1. Did your estimations reflect the actual effort?

Yes, overall the estimations were fairly accurate. The smaller tasks, such as viewing parking spaces and registering vehicles, were easier to complete, while more complex tasks, such as license validation and managing parking reservations, required more effort. Using story points helped us estimate the difficulty of each task before starting the sprint.

2. Was your backlog well-prioritized?

Yes, I think the backlog was well-prioritized. We gave higher priority to important features such as managing parking spaces, creating reservations, validating driving licenses, and recording vehicle entry and exit. These features directly support the main functionality of the smart parking system, while reporting and analytics could be handled after the core operations were established.

3. How did your simulated sprint align with your plan?

The simulated sprint followed our plan quite well. We started with the user stories in the To Do column and moved them to In Progress and Done as the work was completed. This helped us understand how tasks are managed during a Scrum sprint and allowed us to track the progress of the smart parking system step by step.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart gave us a clear idea of how much work was completed and how much work was remaining throughout the sprint. It showed the reduction in story points as the team completed the assigned user stories. This helped us understand our team's capacity and determine whether the planned workload could realistically be completed within the sprint.
